3. Of Grafting, and the ſeveral wayes thereof; together with the due Preparation and Time for it. Here the Author treats of Stock-or Cleft-grafting; of Whip-grafting, (otherwiſe called Packing or Splicing;) of Shot grafting, like the ſhooting of two pieces of timber, as in a Ship-maſt, together; of a Peculiar way of grafting, much uſed by ſome of the beſt Nurſery-men about *London*, here commended for its certainty and eaſie diſpatch; of a ſingular way, tryed by the Author, and by him eſteemed the neareſt and leaſt dangerous and hurtful for the grafting of great Stocks. In this ſame *Chapter* is diſcourſed of *Inarchings*, to be uſed in Trees, whoſe Cions will not be grafted if taken clean from the Tree, whereon they grew at the firſt: Where the Reader is taught, how in a year or two ſtore of Aprecocks may be produced without Inoculation, by ſetting before-hand Plum-ſtocks round about an Aprecock-Tree at ſuch a diſtance, as that they may be grafted by theſe wayes of Inarching.

4. Certain Rules to be obſerved *in* and *after* Grafting; together with a cenſure of vulgar Grafters, that always pick off the ſide-buds, till ſuch time as the Tree is high enough: Adding alſo ſome advertiſements for the Choice of Grafts.

5. Of Inoculation, and the principal time for it; together with directions, what ſort of Trees are firſt to be inoculated, which laſt, and which between both: As alſo, of the quickeſt and ſafeſt way of Inoculation; and of the Authors opinion concerning that manner of Inoculation, which is made without taking away the wood from within the Eſcutcheons. To which are added inſtructions concerning the fitteſt Weather for inoculating; and how to prevent miſchief by much heat, drought, and hard winter; as likewiſe a mark whereby to know, whether the bud have taken or no. All which is concluded with an aſſignment of the Cauſe, why the greateſt part of Trees yield better and fairer fruit through Inſition, than when permitted to bear from Seed? The determination of which is here attempted to be made by comparing Trees and Animals, and by the conſideration of the manner of Nutrition in the latter.

6. Of Stocks raiſed without Seed, and Trees without Inſition: concerning which the Author delivers ſome things concerning Stocks procured out of the Woods, and Suckers from the Roots of Trees, where Seedlings cannot be obtained. To which are added the ways of propagating Trees by *Layers*; as alſo by Roots left in the ground.

Advertiſement.

IT was thought fit, herewith to give the Reader notice, that the next of theſe Tracts will not come abroad till the end of *October* next.
